#### Has the WTO affected trade?

AED/IS 4540 International Commerce And the World Economy

Professor Sheldon sheldon.1@osu.edu

#### **Evidence on trade and the WTO**

- Rose (2004) reported rather surprising result: no evidence GATT/WTO increased world trade
- Observed However, Subramanian and Wei (2007) using more disaggregated data found:
  - developed country members of GATT/WTO witnessed large increase in trade compared to developing country members
  - among developing countries, those joining WTO after completion of Uruguay Round have seen larger increases in trade, e.g., China
- Results confirmed in subsequent empirical work (Chang and Lee, 2011; Eicher and Henn, 2011)

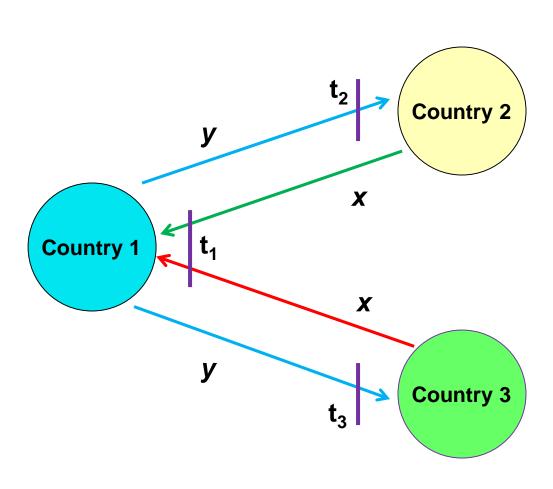

### Developing countries and the WTO

- Developing countries got "free pass" to tariff cuts negotiated in GATT/WTO under MFN clause but did not have to reciprocate, i.e., special and differential treatment (SDT)
- Objective to ensure developing countries gained market access to developed countries
- Despite "free pass" to such tariff reductions, developing countries then lost voice over which sectors to liberalize – i.e., textiles, clothing, and agriculture have seen least trade liberalization

## Why might SDT be a problem?

- igoplus Imagine 3 countries, i =1,2,3 where 1 imports good x from 2 and 3, and 1 exports good y to 2 and 3 (see figure)
- **Allow for trade negotiations where:** 
  - 1 and 2 reduce their tariffs t<sub>1</sub> and t<sub>2</sub>
  - 3 faces tariff cut on t<sub>1</sub> via MFN, but under SDT, it does not cut its tariff t<sub>3</sub>
- ♦ Assume there is "balance of concessions" between 1 and 2 (empirical evidence suggests reciprocity has been norm, e.g., Limao, 2006)

### Structure of trade and tariffs

# Why might SDT be a problem?

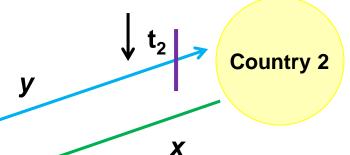

- $\bullet$  1 cuts tariff on x, local price of x decreases and world price of x increases consumers in 1 import more x from 2
- ♦ 2 cuts its tariff on y, local price of y decreases and world price of y increases consumers in 2 import more y from 1
- ♦ Both 1 and 2 gain increased market access for their exports, but terms of trade remain unchanged, i.e., px/py is constant
- ♦ 3 faces no change in its terms of trade, and its local price of y does not change

### Relative prices with tariff-cuts

$$\overline{\mathbf{p}}^{\mathsf{w}} = \frac{\mathbf{p}_{\mathsf{x}} \uparrow}{\mathbf{p}_{\mathsf{y}} \uparrow}$$

**Country 1** 

Prices in Country 2 if  $t_1$  and  $t_2$  are cut:

$$\uparrow \mathbf{p}^2 = \frac{\mathbf{p}_x \uparrow}{\mathbf{p}_y \downarrow}$$

Prices in Country 1 if  $t_1$  and  $t_2$  are cut:

$$\downarrow \mathbf{p}^{\scriptscriptstyle 1} = \frac{\mathbf{p}_{\scriptscriptstyle x}}{\mathbf{p}_{\scriptscriptstyle y}} \uparrow$$

y t<sub>3</sub> Country 3

X

Prices in Country 3 if  $t_1$  and  $t_2$  are cut:

$$\uparrow \mathbf{p}^3 = \frac{\mathbf{p}_x \uparrow}{\overline{\mathbf{p}}_y}$$

# Why might SDT be a problem?

- $\diamond$  As local price of x falls in 1, its consumers substitute away from y to x, and resources shift to producing and exporting more y (vice-versa in 2)
- $\diamond$  1's increased demand for x is met by 2, while 2's increased demand for y is met by 1
- ullet Hopes of 3 for "free pass" under SDT not realized as it cannot compete with 2 in exporting x to 1
- Maxim in trade negotiations: "what you get is what you give", i.e., tariff cuts can stimulate exports

# The "latecomers" problem

- ♦ As well as concerns over SDT, the WTO may face a "latecomers" problem, i.e., globalization fatigue
- Reciprocal bargaining among developed countries has gone on for over 50 years – tariffs on manufactures are now very low
- ◆ Local price distortions in developed countries have been already eliminated, making it difficult for them to identify new tariff bargains with developing countries
- Question: how can "room be made at the table" for developing countries? (Bagwell and Staiger, 2014)
