## THE GAINS FROM TRADE

## FIGURE 1: GAINS FROM TRADE

## FIGURE 2: MUTUAL GAINS FROM TRADE

## FIGURE 3: MAXIMIZATION OF VALUE OF OUTPUT AT WORLD PRICES

In comparing $Q$ with $A$, we can say:

$$
\begin{aligned}
& \mathbf{P}_{\mathrm{x}} * \mathbf{X}_{\mathrm{p}}^{\mathrm{t}}+\mathbf{P}_{\mathrm{y}} * \mathbf{Y}_{\mathrm{p}}^{\mathrm{t}} \geq \mathbf{P}_{\mathrm{x}} * \mathbf{X}^{\mathrm{a}}{ }_{\mathrm{p}}+\mathbf{P}_{\mathrm{y}} * \mathbf{Y}_{\mathrm{a}}^{\mathrm{a}} \\
& P_{x}{ }^{*}=\text { world price of } X, P_{y}^{*}=\text { world price of } Y \\
& X_{p}^{t}=\text { free trade production of } X \\
& \mathbf{Y}_{\mathrm{p}}^{\mathbf{t}}=\text { free trade production of } \mathbf{Y} \\
& X^{a}{ }_{p}=\text { autarky production of } X \\
& Y^{\mathrm{a}}{ }_{\mathrm{p}}=\text { autarky production of } \mathbf{Y}
\end{aligned}
$$

Under autarky, there must be market-clearing:

$$
\begin{equation*}
\mathbf{X}_{\mathrm{p}}^{\mathrm{a}}=\mathbf{X}_{\mathrm{c}}^{\mathrm{a}}, \mathbf{Y}_{\mathrm{p}}^{\mathrm{a}}=\mathbf{Y}_{\mathrm{c}}^{\mathrm{a}} \tag{2}
\end{equation*}
$$

Under trade, there must be balanced trade:

$$
\begin{equation*}
\mathbf{P}_{\mathrm{x}} * \mathbf{X}_{\mathrm{c}}^{\mathrm{t}}+\mathbf{P}_{\mathrm{y}} * \mathbf{Y}_{\mathrm{c}}^{\mathrm{t}}=\mathbf{P}_{\mathrm{x}} * \mathbf{X}_{\mathrm{p}}^{\mathrm{t}}+\mathbf{P}_{\mathrm{y}} * \mathbf{Y}_{\mathrm{p}}^{\mathrm{t}} \tag{3}
\end{equation*}
$$

Substituting (2) into the right-hand side of (1), and (3) into the left-hand side of (1), we get:

$$
\begin{equation*}
\mathbf{P}_{\mathrm{x}} * \mathbf{X}_{\mathrm{c}}^{\mathrm{t}}+\mathbf{P}_{\mathrm{y}} * \mathbf{Y}_{\mathrm{c}}^{\mathrm{t}} \geq \mathbf{P x}^{*} * \mathbf{X}^{\mathrm{a}}{ }_{\mathrm{c}}+\mathbf{P} \mathbf{y} * \mathbf{Y}^{\mathrm{a}}{ }_{\mathrm{c}} \tag{4}
\end{equation*}
$$

From (4), the Gains From Trade Theorem can be stated:

If the value of production is maximized at free trade prices, then the value of free trade consumption at free trade prices exceeds the value of autarky consumption at free trade prices. Hence, the free trade consumption bundle must be preferred, otherwise consumers would pick the cheaper autarky bundle

Note, sufficient conditions for this to hold are:

- the tangency condition, i.e. world prices are tanget to the production frontier
- the convexity condition, i.e. production sets are convex - production frontier is concave

These conditions generally hold if:

- there are constant returns to scale
- perfect competition exists
- there are no distortions such as production taxes

## FIGURE 4: EXCHANGE/SPECIALIZATION

$\mathbf{Y}$
(food)

Gains from exchange: $\mathrm{A} \Rightarrow \mathrm{E}$
$\underline{X} \quad \mathbf{X}$ (non-food)
Gains from specialization: $\mathrm{E} \Rightarrow \mathrm{C}$
