FILING WTO VIOLATION AND NON-VIOLATION COMPLAINTS:
A POSSIBLE SOLUTION TO CHINA’S MARKET ACCESS COMMITMENTS?

RICE UNIVERSITY BAKER INSTITUTE FOR PUBLIC POLICY
PROJECT ON U.S.-CHINA TRADE ISSUES

July 28, 2022

Ian M. Sheldon*

A key omission of the 2020 United States China Economic Trade Agreement (USCTA) was any chapter covering China’s use of subsidies and their market access commitments under the World Trade Organization (WTO). While USCTA did not result in U.S. and Chinese tariffs being returned to their pre-trade war bound levels, the commitments made by China to meet specific import targets over the period 2020-21, suggest it might be willing to re-establish reciprocity with the United States without necessarily reforming its current economic system. The argument presented in this article is that, while the United States should file both WTO violation and non-violation complaints against China, the latter, if successful could allow China to maintain its use of industrial subsidies subject to it either maintaining its market access commitments to the United States or providing the latter with some form of compensation.

I. INTRODUCTION

Professor Daniel Chow’s accompanying article to this one, lays out the background to the signing of the United States China Trade Agreement (USCTA) in January of 2020, along with detailed analysis of the intellectual property chapter of USCTA, and a critique of its dispute resolution mechanism. Importantly, while USCTA contains chapters on other issues including technology transfer and exchange rates, it does not address China’s use of subsidies and their

* Andersons Chair of Agricultural Marketing, Trade, and Policy, The Ohio State University Department of Agricultural, Environmental, and Development Economics.
impact on market access. In this context, the argument presented in this article focuses on the case for the United States filing both violation and non-violation complaints at the World Trade Organization (WTO) against China. To develop the analysis, the article is broken down into the following sections: in section II, by way of background, the post-WWII success of the multilateral trading system is described, followed in section III by an outline of the effects on the U.S. economy and body-politic of the Chinese import shock; in section IV the U.S. resort to “power-based” bargaining against China is evaluated, with suggestions on how to deal with China’s economic model being presented in section V. Some final conclusions are drawn in section VI, key being the need to resolve the impasse in the WTO dispute settlement mechanism.

II. THE GATT/WTO AS A “RULES-BASED” TRADING SYSTEM

The “rules-based” multilateral trading system established under the General Agreement on Tariffs and Trade (GATT) and its successor the WTO is based on two pillars constraining exercise of bargaining power: reciprocity where member countries seek a balance of tariff concessions in trade negotiations, and non-discrimination through the most-favored nation (MFN) principle. These rules, along with the argument GATT/WTO has ensured resolution of a terms-of-trade prisoners’ dilemma, have resulted in progressive reduction of tariffs in the post-war period, and a substantial increase in the global volume of trade.

By some simple metrics, the GATT, and its successor the WTO, has been a very successful institution of international governance. GATT/WTO has established a rules-based system for world trade based on a set of principles enshrined in the GATT Articles, along with a dispute settlement system, that have been universally accepted and respected by its members. Membership has grown from the 23 countries that signed the GATT in 1947 to 164 countries

---

2 The MFN principle requires each WTO member to extend a trade benefit given to one country to all other members of the WTO, the purpose being to universalize benefits to all other WTO members and serve as an inducement to join the WTO. See Daniel C.K. Chow and Thomas J. Schoenbaum, *International Trade Law: Problems, Cases, and Materials* (New York, NY: Wolters Kluwer, 2017), 149-150.

today.\textsuperscript{10} Currently, WTO members account for more than 95 percent of both global trade and gross domestic product (GDP).\textsuperscript{11} Over the 70 years of its existence, the GATT/WTO has witnessed eight rounds of trade negotiations, resulting in average industrial tariffs being reduced to less than 4 percent,\textsuperscript{12} although there is quite a bit of variation in the average level of applied tariffs across both countries and sectors.\textsuperscript{13}

There have been several studies exploring the relationship between membership of the GATT/WTO and countries’ trade flows. An initial finding came as something of a shock to trade economists: membership of the GATT/WTO was not correlated with increased trade flows as compared to non-member countries.\textsuperscript{14} Not surprisingly this generated follow-up research. A widely accepted study argues the impact of a country’s membership of GATT/WTO will depend on three dimensions: first, what a country does with its membership; second, with which other countries a country negotiates; and, third, which products are covered in trade negotiations.\textsuperscript{15} The reported empirical results are consistent with these predictions: industrial countries participating in reciprocal trade negotiations have enjoyed a significant increase in trade, bilateral trade has been greater when both countries engage in tariff reduction as compared to when only one country does, and sectors such as agriculture that were not initially covered by trade negotiations exhibited little or no increases in trade.\textsuperscript{16} Subsequent empirical work finds countries’ agricultural trade has been significantly increased by their membership of GATT/WTO.\textsuperscript{17}

These results, confirmed by additional empirical studies,\textsuperscript{18} have been interpreted in the context of developing countries receiving special and differential treatment (SDT) under GATT/WTO rules.\textsuperscript{19} Specifically, developing-country members of GATT/WTO have been

\textsuperscript{10} See James P. Murphy and Carolan McLarney, “Regionalism and the Multilateral Trading System,” in Angelo Presenza and Lori R. Sheehan (Eds.), Geopolitics and Strategic Management in the Global Economy (Hershey, PA: IGI Global, 2018), 1-18, 3.

\textsuperscript{12} See Jackson, supra note 1, at 74.

\textsuperscript{13} See Baldwin, supra note 4, at 99; see also Kyle Bagwell, Chad P. Bown, and Robert W. Staiger, “Is the WTO Passed?” 54 Journal of Economic Literature, 54, no.4 (Dec. 2016): 1125-1231, 1131.

\textsuperscript{16} See Id., at 151-153.

exempted from its reciprocity norm, i.e., developing countries have got a “free pass” by benefitting from any tariff cuts negotiated between industrialized countries under the MFN rule while not being required to cut their own tariffs. However, by not lowering their own tariffs, developing country resources were often retained in inefficient import competing sectors.\(^{20}\) This effectively has acted as a tax on their export competing sectors, i.e., in trade negotiations, “…what you get is what you give…”\(^ {21}\) The conclusion to be drawn from the extant empirical research is that membership of GATT/WTO can be characterized as the outcome of a cooperative game that has generated mutual benefits for its members in the form of increased trade volumes, and particularly for countries engaging in reciprocal tariff-cutting.

### III. THE CHINA IMPORT SHOCK

The multilateral trading system just described faced a major challenge when the Trump administration instigated a trade war with China in 2018. The build up to this war should be placed in the context of the rapid growth in globalization in the two decades following China’s entry to the WTO in 2001.\(^ {22}\) Prior to the 1990s, the flow of trade in goods was mostly between developed countries (the “North” versus developing countries, the “South”).\(^ {23}\) High-income countries accounted for 80 percent of world trade in 1985.\(^ {24}\) Specifically, countries with similar GDP/capita produced goods such as automobiles, constrained by economies of scale and the size of their own market, and then traded those goods with other high-income countries in a larger integrated market for similar but differentiated goods.\(^ {25}\) The view among economists is that trade within these industries with an expanded international market not only resulted in consumers benefiting from a greater variety of goods, but that it also helped minimize the costs to “losers,” as it is easier to reallocate resources within industries than to reallocate from one industry to another.\(^ {26}\) This reduced the impact of trade on the distribution of income.\(^ {27}\)

With growth in trade accelerating after the Second World War, concerns were expressed in the 1980s about growing income inequality in the United States, reflected in the increasing gap between skilled and unskilled wages.\(^ {28}\) Critics of globalization put part of the blame on growing imports from low-wage developing countries in the global South.\(^ {29}\) However, empirical

27 See Id., at 971
29 See Id., at 104.
analysis published in the early to mid-1990s concluded that the effects of North-South trade on U.S. income inequality were very modest.\textsuperscript{30} By the start of the 2000s, the consensus among trade economists was that trade was not a key contributing factor in either declining employment in the U.S. manufacturing sector or rising income inequality.\textsuperscript{31} Economists argued that observed changes in the U.S. labor market were mainly due to technological change in the manufacturing sector, which complemented more-skilled workers, thereby driving up skilled relative to unskilled wages.\textsuperscript{32} For example, technological change through automation has reduced demand for less-skilled assembly jobs in manufacturing, while raising productivity and wages of more-skilled labor.

At the same time that economists reached a consensus that technological change was the main factor causing loss of U.S. manufacturing jobs, exports from “factory China” exploded.\textsuperscript{33} Chinese exports gave skeptics a reason to question whether technological change or sharply rising exports from China was the cause of negative impacts on less-skilled labor.\textsuperscript{34} Between 2000 and 2007, U.S. import penetration by low-wage countries grew from 15 to 28 percent, China’s share of this growth being 89 percent.\textsuperscript{35} The value of US imports from China rose by 171 percent between 2000 and 2007, compared to growth in U.S. exports to China of 150 percent.\textsuperscript{36} U.S. manufacturing faced a significant increase in Chinese import competition without an offsetting increase in exports—a pattern shared by virtually all industrial sectors.\textsuperscript{37} This import shock was not unique to the United States, for example, China’s share of UK manufacturing imports rising from one to 8.6 percent over the period 1988-2007.\textsuperscript{38}

There is now a growing body of research examining the impact of the China import shock on U.S. employment and other metrics.\textsuperscript{39} For example, one study found that extension by the United States of permanent normal trade relations (PNTR) to China in 2000 was associated with a sharp drop in U.S. manufacturing employment between 2000 and 2003, the effect being stronger in industries most affected by a reduction in uncertainty about tariff rates.\textsuperscript{40} Other analysis measures the geographic exposure of labor markets across the United States to the

increase in imports from China.  

As already noted, the “shock” feature of Chinese imports relates to the rapid rise primarily in manufacturing imports from China since the mid-1990s. The rising international competitiveness of China has been associated with increased openness in China that has allowed Western firms to outsource production activities to China, the relaxation of central planning, accession to the WTO in 2001 and possible manipulation of their exchange rate. Not only has the rise in China’s competitiveness given rise to concerns about “unfair” trade, but the extent and speed of the rise in imports from China has forced considerable adjustment in importing countries with the resulting impact on regional labor markets in importing countries where manufacturing activities are located.

Key to identifying the impact on labor is the definition of a labor “market”. Rather than assume labor is mobile within national borders, extant research has focused on commuting zones, defined as the distance workers would reasonably commute to work, with commuting zones being located across the United States. A key feature that arises from using commuting zones as a unit of measurement is that labor does not have a strong tendency to change commuting zones. In other words, labor is not that mobile in contrast to what trade theory typically assumes.

By overlaying the industrial structure of U.S. commuting zones, analysis has gauged the impact of exposure these industries have to competition from Chinese imports. Since this matches the characterization of commuting zones, they are then able to assess the impact of the recent rise of China on local labor markets. Since labor does not have a strong tendency to move, the impact of Chinese imports has been particularly strong across certain U.S. states: wages falling dramatically, women withdrawing from the workforce, there has been an increase in demand for social benefits and disability allowances and when workers re-engage in the same commuting zone, re-hiring has been at wages much lower than previous employment. This has been the main feature of the “China shock”: the geography was felt dramatically in several, typically southern and eastern states while other states escaped the impact of the rise of China given the differences in industrial structure. In sum, the growth of China has had a significant effect on certain parts of the United States.

Analysis of the “China shock” has been extended to an examination of voting patterns across the U.S. Using detailed data on voting in congressional and presidential elections, they report two main results. First, while accounting for other determinants of voting patterns, e.g., education, age, white collar etc., due to the dramatic rise in imports from China, voters were less likely to support moderate candidates of either political party. There was a swing to either end of the political spectrum reflecting an increase in polarization in the U.S. political environment. Second, in presidential elections, in the districts most exposed to competition from Chinese

imports, the “China shock” was reflected in an increase in support for Republican candidates.\textsuperscript{47} Although there may be other factors that have contributed to the divisiveness of U.S. politics in recent years, a clear link has been established between the impact of globalization and political outcomes and ties closely with the targeting of tariffs by the Trump administration. Both presidential candidates explicitly highlighted competition from China in their 2016 electoral campaigns, the results here suggesting that the competition from China favored the Republican candidate.

IV. U.S. TRADE BARGAINING

A. From a “Rules-Based” Trading System to “Power-Based” Bargaining

An interpretation of the trade war between the United States and China is the former switching from a “rules-based” to a “power-based” approach to trade negotiations, targeting higher “bargaining” tariffs at a country with which it has consistently run a bilateral trade deficit.\textsuperscript{48} This switch in trade policy emphasis has been driven by several other well-documented concerns the United States has about its trade relations with China, including the latter’s higher average bound tariffs, manipulation of its exchange rate, and its violation of WTO rules.\textsuperscript{49} A key component of this “power-based” approach is the United States has also disabled the dispute settlement system of the WTO by paralyzing its Appellate Body.\textsuperscript{50}

Superficially, “power-based” bargaining has worked: in signing USCTA on January 15, 2020,\textsuperscript{51} China committed to a voluntary import expansion (VIE) over 2017 baseline levels, implying a combined $200 billion worth of additional imports of U.S. products (agricultural, manufactured, and energy) and services for the two-year period January 1, 2020, through December 31, 2021.\textsuperscript{52} China’s imports from the United States reached 59 percent of their commitment for 2020, and by the end of December 2021, they had reached only 57 percent of

\textsuperscript{47} See Id., at 3175-3176.
their two-year commitment.\textsuperscript{53} In the case of the agricultural and manufacturing sectors, China reached 83 and 59 percent respectively of their two-year commitments.

At the time these commitments were made, they were characterized as VIEs,\textsuperscript{54} that would be difficult for Chinese state-owned enterprises (SOEs) to meet under a regime of managed trade.\textsuperscript{55} Two interdependent factors were considered to militate against SOEs satisfying the import targets. First, private trading firms have been mostly responsible for Chinese imports, SOEs purchasing only 26 percent of Chinese imports in 2019.\textsuperscript{56} Second, despite the USCTA, China did not formally reduce its retaliatory tariffs. Instead on February 17, 2020, the Chinese Ministry of Finance established a process by which tariff exemptions could be requested. It is unclear how many exemptions have been made and subsequently accepted, by which firms in which industries, and firm-type (private vs. SOE).\textsuperscript{57} Essentially, imports would be based on choices made by the Chinese government.

Compared to the metric of bound MFN tariffs, proving China has deliberately not met its import commitments runs up against the counterfactual that substantial shocks to demand, and supply are likely to have affected the outcome.\textsuperscript{58} In terms of its import commitments, China clearly underperformed relative to the target(s), although this should be placed in the context of how the COVID-19 pandemic has affected global trade flows. Analysis of the pandemic indicates agricultural trade has been resilient compared to trade in manufactured products,\textsuperscript{59} China accounting for 95 percent of the observed $20 billion increase in world agricultural trade in 2020.\textsuperscript{60} The import demand shock, especially for grain and soybean-use in animal feed, has been driven by China rebuilding its hog production capacity devastated by African Swine Fever in 2018. Critically, Chinese tariff exemptions on agricultural imports appear to be fundamentally

\end{itemize}
\end{small}
market-driven, i.e., it is a stretch to claim U.S. “power-based” bargaining has worked exclusively because of a trade agreement centered on VIEs.

Bringing China to the trade negotiating table, has also come at considerable actual and potential cost, and does not substantively contribute to resolution of a fundamental problem facing the WTO: how to deal with China’s current economic model. To paraphrase the prescient testimony of former Appellate Board member Jennifer Hillman to the U.S.-China Economic and Review Security Commission in 2018, the U.S. has not avoided “…a narrow, deficit-focused bilateral deal…”

B. The Cost of “Power-Based” Bargaining

With respect to the United States’ imposition of tariffs on China, the economists’ case against protection, which can be found in any undergraduate textbook on international trade, is at once both straightforward and nuanced. The standard view is a country choosing protection will suffer a loss in national welfare as measured by a reduction in its GDP. This follows from the fact that tariffs provide an incentive for resources to remain in inefficient import-competing sector(s) rather than being reallocated to more efficient export-competing sector(s), i.e., the classic economic gains from specialization are foregone. In addition, tariffs result in significant distributional effects between both consumers and firms, as well as consumers and the government, consumers paying a higher price for goods produced domestically as well as paying tariffs on imported goods. The net effect is that consumers end up losing more than domestic firms and the government exchequer gain, i.e., there is “deadweight” loss from protection. More recent economic analysis highlights additional costs to firms - given that tariffs may be applied to traded intermediate inputs such as automobile parts, with the increasing importance of value-chains, tariffs increase costs to firms who rely on imported intermediate inputs.

The exception to the standard economic case against tariffs is when a country is “large” enough to affect its international terms-of-trade, i.e., the price it pays on the world market for imports relative to the world price of its exports. In the case previously outlined, the world price of imported goods does not change with the imposition of tariffs as the importing country is too “small” to exercise any market power. However, if an importing country is large enough, the

65 See Id., at 246-249.
66 See Id., at 246-249.
67 See Id., 281-284.
world price of its imports will fall as the tariff is imposed. In this case, national economic welfare may increase, as the deadweight losses borne by consumers are more than compensated for by additional tariff revenue. In other words, part of the cost of the tariff is now borne by exporting countries who face a lower world price for their exports, i.e., they suffer an international terms-of-trade loss. However, this case only applies if we assume that the exporting country facing the increase in tariffs does not retaliate. If it does, the tariff “war” that arises leads to economic losses for both countries due to a terms-of-trade “prisoners’ dilemma.” To the extent that the trade war between the United States and China is representative of this case, both countries, including the United States as instigator of the trade war, have incurred economic losses.

Not surprisingly, given the height and breadth of the tariffs applied by the United States against China in 2018, analysis of the short-run economic impacts has already been published. Without discussing the technical details, one study quantifies the impact of the trade war on the United States for 2018 as follows: first, U.S. consumers of imported goods in aggregate lost $51 billion due to higher prices; second, U.S. exporters saw an increase in their income of $9.4 billion; and third, U.S. tariff revenue totaled $34.3 billion. Therefore, the net effect of the trade war was an aggregate loss of U.S. real income of $7.3 billion, which can be thought of as an approximation of the deadweight loss from tariffs. This compares to a second study which estimated a net real income loss of $8.2 billion. Not surprisingly, there is an ongoing debate in the Biden administration over cutting these tariffs to reduce the current U.S. rate of inflation. Available estimates suggest that eliminating the tariffs against China would result in a 1.3 percentage point long-term reduction in the consumer price index (CPI), increasing to a 2.0 percentage point reduction if other trade barriers were reduced.

These studies have also found the incidence of U.S. tariffs was almost entirely borne by U.S. consumers, which is a somewhat surprising result given the growing empirical support for both the idea importing countries have market power, and the terms-of-trade theory of trade agreements. Over a longer time-period, it might be expected exporters would eventually cut

75 See Amiti et al., supra note 61, 199-201.
before-tariff prices, especially if there was resolution of exporter uncertainty about how long the tariffs will remain in place.\textsuperscript{79} Interestingly, a follow-up study with data for 2019, finds some variation across sectors, e.g., U.S. tariffs led foreign steel exporters to lower their before-tariff prices.\textsuperscript{80}

In terms of U.S. exports, retaliatory tariffs disproportionately affected agricultural products compared to other sectors, and the tariff increases were also steeper. Empirical analysis indicates the U.S. agricultural sector suffered annualized trade losses of $13.5 to $18.7 billion, China accounting for the majority and severity of the retaliation, damage to soybean exports being estimated at $10.7 billion.\textsuperscript{81} Importantly, with China being the world’s largest soybean importer, it was able to negatively affect U.S. international terms-of-trade, the average U.S. soybean export price falling significantly when tariffs were initially implemented by China, putting downward pressure on U.S. farm incomes,\textsuperscript{82} with a significant amount of trade also being diverted to other exporting countries such as Brazil.\textsuperscript{83} This resulted in compensatory payments to U.S. farmers through the Market Facilitation Program (MFP), pushing the United States close to violating its WTO commitments on farm subsidies in 2019 and 2020.\textsuperscript{84}

In summary, the evidence clearly shows the incidence of import tariffs implemented in 2018 was entirely borne by U.S. consumers, any terms-of-trade effects on the import side being insignificant. Also, if there had been no retaliation by China and other countries, there would have been a modest U.S. real income gain of $0.5 billion in 2018 due to terms-of-trade effects on the export side. In other words, the logic of “power-based” bargaining only ever had the potential to work if China and other countries had not adopted a trigger strategy in response to the increase in U.S. tariffs.

The overall conclusion is the U.S.-China trade war has come at a cost to U.S. consumers, taxpayers, and exporters. In addition, under USCTA, neither country has committed to returning tariffs back to their pre-2018 bound levels. For all intents and purposes, the United States and China have suspended their GATT/WTO obligations under GATT Article XXIII. This has

significant long-run implications for the “rules-based” multilateral trading system. First, any initial advantage the United States might have gained by applying bargaining tariffs has likely been lost as China and other countries such as the EU have retaliated. This has the potential to undermine the cooperation necessary for multilateral as opposed to bilateral trade negotiations, with implications for enforcement. Second, if the multilateral system is undermined when the United States is the dominant economic power, it may prove harder for China to make credible commitments to a “rules-based” mechanism when it eventually becomes the dominant economic power.

C. “Power-Based” Bargaining: What is Missing?

Despite the documented disruption and economic damage due to the U.S.-China trade war, why has the United States put the multilateral trading system at risk through “power-based” bargaining? Pronouncements by the previous administration on the USCTA indicate a prime goal of the agreement was to reduce the trade deficit with China, which squares with the rationale for U.S. targeting of its “bargaining” tariffs. The extensive focus on China’s progress in meeting its import commitments under USCTA also lead to a conclusion the agreement was essentially about reducing the bilateral trade deficit with China.

To be fair, while the official text of USCTA is remarkably short for a typical trade agreement, it does focus on more than expansion of trade, other chapters covering protection of intellectual property, technology transfer, non-tariff barriers to agricultural trade, financial services, exchange rates, and dispute resolution. It is too early to evaluate the impact of these chapters of USCTA, but conspicuous by its absence is any mention of disciplines on SOEs and China’s use of subsidies.

Imposition of tariffs by the United States reflects its and other countries’ concerns about the Chinese economic model that has evolved since 2001. Key to this is that, while Chinese firms compete with one another, they may be subsidized relative to their foreign competition. First, SOEs in some industries face soft budget constraints. Second, some Chinese firms are

85 See Mattoo and Staiger, supra note 48, 570-573.
87 See Mattoo and Staiger, supra note 48, 573-576.
89 See Mattoo and Staiger, supra note 48, at 573-576.
90 See Hillman, supra note 63, at 3.
91 See Office of the United States Trade Representative (USTR), supra note 51.
influenced either directly or indirectly by the Chinese Communist Party (CCP). This phenomenon, denoted as “China Inc.”, is one where intervention in the Chinese economy does not always flow through the state, the CCP functioning as a separate actor.\(^{94}\) In combination with an emphasis on market forces, the Party-state can influence economic outcomes through: controlling key sectors of the Chinese economy (aerospace, aviation, energy, transport, communications etc.); directing financial resources via large Chinese banks; guiding and coordinating government agencies and firms via Party entities such as the Central Financial and Economic Affairs Commission; facilitating coordination through informal networks in specific sectors; setting performance metrics and controlling hiring within government, SOEs, banks etc.; and, developing formal and informal linkages between the Party and private firms. The net result of “China Inc.” is subsidies are often targeted through informal channels and not directly via the state.\(^{95}\) Third, use of export taxes, and the discriminatory rebate of value-added taxes on exports act as implicit export subsidies, e.g., export taxes on raw materials drive down their domestic price(s), providing a competitive advantage to downstream users (Garred, 2018).\(^{96}\)

V. WHAT CAN BE DONE ABOUT CHINA’S ECONOMIC MODEL?

Given U.S. concerns about China’s economic model, and how it feels constrained by the WTO from using what it regards as legitimate trade remedies against China, it is surprising the issue is totally invisible in the USCTA. Essentially, “power-based” bargaining in this respect has been a failure, even though it brought China to the bilateral bargaining table. Are there any alternatives?

Hillman has argued the United States should form a coalition with other WTO members to put together a comprehensive case against China.\(^{97}\) In her Congressional testimony, she lays out in detail, the legal reasoning for filing both violation and non-violation cases against China on the grounds that its trade and other measures “nullify or impair” the benefits of the U.S. and other WTO members. To understand the potential role either a violation and/or a non-violation claim could play in addressing the problem of “China Inc.”, it is important to start with the economic logic of the GATT/WTO.\(^{98}\)

A. The Economic Logic of GATT/WTO

Assume a world where two countries produce and consume two final products, each country having a comparative advantage in producing one of the goods, both countries being large enough to influence their terms-of-trade through exploitation of their market power, i.e., as noted earlier, if they implement a tariff the world price of their imports will fall relative to the world price of their exports. With appropriate assumptions, the economic welfare of each country can be defined as a function of these tariffs, the terms-of-trade gain to each country,

\(^{94}\) See Wu, supra note 92, at 282-284.
\(^{95}\) See Id., at 282-284.
\(^{97}\) See Hillman, supra note 63, at 2.
measured in terms of additional tariff revenue, outweighing any deadweight loss from higher domestic prices due to the tariff. In the absence of a trade agreement, neither country can change their tariff strategy and be better off. The net result is each country loses market access to the other country’s market, the reduction in the volume of international trade being economically inefficient.

The latter outcome suggests it is beneficial for countries to agree to reduce their tariffs, and in the absence of a binding bilateral agreement between them, the GATT/WTO has essentially neutralized the terms-of-trade incentive for countries to raise tariffs. In other words, if terms-of-trade effects have been removed from any country’s objective function, it will set tariffs to satisfy domestic political objectives alone. These tariffs would be either zero if a country seeks to maximize its national income through free trade, or they would be positive to satisfy domestic political constraints, but importantly, they are lower than those at the non-cooperative equilibrium. Therefore, if countries enter into a trade agreement, they seek mutual reductions in tariffs generating an increase in domestic and global economic welfare.

The economic theory of trade agreements as outlined has been criticized on the grounds that trade practitioners never actually mention the concept of terms-of-trade in trade negotiations. However, this ignores the relationship between import demand and import prices. Suppose one country lowers its import tariff, which shifts out its import demand curve, resulting in an increase in the world price of the imported good (a worsening of its terms-of-trade). Necessarily, this has an import volume effect, i.e., the other country gets increased market access as their terms-of-trade improve. In other words, the problem with the non-cooperative tariff equilibrium can be recast as one of insufficient market access. Therefore, a link can be made between the terms-of-trade theory, changes in relative prices, and the focus of trade negotiators on market access.

Market access should be seen in the context of what is termed first-difference (marginal) reciprocity where trade negotiations focus on balancing concessions on tariffs given an initial set of conditions. A dynamic process can be described where negotiators trade off increased access to their own markets through tariff cuts in exchange for access to export markets, i.e., the concerns of those lobbying for the import-competing sectors are balanced by those lobbying for the export-competing sectors. In other words, negotiations in the GATT/WTO have proceeded on the basis that there will be a balance of trade concessions between member countries, measured in terms of increased market access, but in the final deal, each member country continues to protect a set of politically-sensitive sectors that will likely differ across countries.

The lower tariff equilibrium under GATT/WTO has also been supported by a credible enforcement mechanism embodied in the dispute settlement system. Standard game theory suggests countries would have an incentive to deviate from a low-tariff equilibrium. In a repeated game, the punishment for not adhering to a trade agreement is reversion to the non-cooperative equilibrium of high tariffs, i.e., what is termed a trigger strategy. In practice, the rules of GATT/WTO seek to maintain the balance of tariff concessions and avoid the use of punitive, and therefore economically destructive actions by a member country.

If one country were to raise its tariff(s), this would imply a loss of previously negotiated market access for the other country. Assuming this action is not “abusive”, under GATT/WTO rules, specifically GATT Article XXIII, subject to the outcome of a violation complaint, the other country can withdraw an equivalent amount of market access. However, if a country deviates in an “abusive” manner, there is reversion to the trigger strategy, i.e., under GATT Article XXIII, there can be an indefinite suspension of GATT/WTO obligations, both countries setting non-cooperative tariffs. While GATT/WTO rules contain no formal definition of an “abusive” deviation, a reasonable interpretation would be a “sufficiently deep” breakage of tariff commitments honored for some time. In other words, the objective of GATT/WTO rules is to ensure retaliation by one country against the unilateral action of another is proportionate, thereby minimizing the chances of a trade war.

The intuition for this result is straightforward: first, if the deviation from the bound tariff by one country is less than the non-cooperative equilibrium tariff, it is not considered “abusive”, the other country withdrawing an equivalent amount of market access in all future periods through setting a similar retaliatory tariff; second, if the deviation from the agreed tariff is greater than or equal to the non-cooperative equilibrium tariff, it is considered “abusive”, the other country setting the higher retaliatory tariff in all future periods. Importantly, where the deviation is not “abusive”, withdrawing an equivalent amount of market access is credible, i.e., the punishing country knows if it instead chooses the more than proportionate tariff, this will result in a suspension of GATT/WTO obligations with indefinite imposition of non-cooperative tariffs by both countries.

The recent history of tariffs imposed by the United States and China on each other’s imports are summarized in Figure 1: prior to 2018, U.S.-China trade-weighted tariff rates toward each other averaged 3.1 and 8 percent respectively. By the end of 2018, trade-weighted average U.S. tariffs on 46.9 percent of its imports from China had been raised to 12 percent, matched by an increase in trade-weighted average Chinese tariffs to 16 percent on 56.3 percent

of its imports from the United States. When the USCTA was signed in early-2020, trade-weighted average U.S. tariffs on 58.3 percent of its imports from China had risen to 19.3 percent (26.7 percent including anti-dumping duties), while trade-weighted average Chinese tariffs on 66.4 percent of its imports from the United States had risen to 20.7 percent (21.2 percent including anti-dumping duties). Therefore, over this two-year period, trade-weighted average U.S. tariffs against China (including anti-dumping duties) more than tripled relative to their pre-2018 level of 8.4 percent, approaching the trade-weighted average tariff level of 28.1 percent imposed under the Smoot-Hawley tariff act of 1930.

This sequence of moves on tariffs bears out the previous discussion. First, the 2018 implementation of tariffs under Section 301 of the U.S. 1974 Trade Act does not satisfy the criterion of being “non-abusive”, there being no attempt by the United States to seek renegotiation of its existing tariff commitments to China under GATT/WTO rules. Second, a WTO panel ruled in China’s favor on September 15, 2020 that the tariffs were “…prima facie inconsistent…” with both Articles I.1 and II of the GATT 1994, i.e., the tariffs are both discriminatory and in excess of the rates “…to which the United States bound itself in its Schedule of Concessions…” (WTO, November 26, 2020). Third, even though China filed a complaint to the WTO in 2018, the fact it retaliated immediately with substantial tariffs of its own suggests it was willing to implement a trigger-type strategy well before the subsequent Panel ruling in 2020. Fourth, the extent of escalation of tariffs by both countries through 2019 indicates both countries had moved towards applying trigger strategies, pushing their bilateral relationship to a non-cooperative equilibrium. Finally, notwithstanding the USCTA, tariffs implemented by both countries remain in place.

B. A Violation Complaint

At the time of its accession to the WTO in 2001, China’s trading partners believed its
tariff bindings and eventual shift to a market-based economy meant that it would meet its WTO
market access commitments, and if it were to deviate from its obligations, a violation
complaint(s) could be/have been filed and litigated successfully under GATT/WTO Article
XXIII 1(a), i.e., the WTO would work as designed.\(^{117}\) Since 2001, “China Inc.” has evolved to
the point where China’s domestic policies likely act as a substitute for its trade policy,
undermining the market access commitments and obligations they signed up for.\(^{118}\)

While China has adopted a variety of domestic policies, the focus here is on subsidies. In
her Congressional testimony, Hillman argues that China has violated two key commitments it
made in acceding to the WTO: first, it has failed to notify the WTO of all subsidies it has granted
or maintained, and second, it has not eliminated all export and import substitution subsidies.\(^{119}\)
From the standpoint of economic theory, subsidies are not necessarily a distorting policy
instrument if used to target some type of market failure such as under-provision of research and
development (R&D).\(^{120}\) They are also a first-best instrument by the targeting principle, i.e., the
market failure should be directly targeted at source.\(^{121}\) Therefore, there is the potential that
proscription of subsidies will lead to a second-best outcome if governments then use import tariffs
and other policies instead.\(^{122}\)

Notwithstanding economic theory, the original GATT rules provided two routes by which
a country could target other countries’ use of subsidies. First, if a subsidy were offered to
exporters which then affected a country’s import-competing producers, under GATT Article
XVI, a countervailing duty (CVD) could be targeted unilaterally against the subsidized exports.
Second, if the subsidy were offered to import-competing firms, under Article XXIII a country
would have recourse to filing a non-violation complaint on the grounds the subsidy negated
previous concessions on market access. These latter disciplines were tightened in the Tokyo
Round of GATT through the plurilateral Agreement on Interpretation and Application of Articles
VI, XVI and XXIII of the GATT (the “Subsidies Code”) with export subsidies (excluding those
in agriculture) deemed a per se violation of the rules.\(^{123}\) Finally, the Uruguay Round of GATT
led to the WTO Agreement on Subsidies and Countervailing Measures (SCM). Importantly, the
Agreement defined a subsidy as a “financial contribution” from a “government or public body”
that confers a “benefit” on the firm receiving it (SCM Article 1).

Analytically, it has been shown the SCM is perhaps too restrictive relative to the first-best rationale for subsidies, providing an incentive for governments to use more indirect and non-transparent second-best policies.\(^\text{124}\) Under the original GATT rules, if a country had a set of domestic policy instruments at its disposal, e.g., subsidies and taxes, and there was a successful non-violation claim, as long as it made a domestic policy adjustment restoring market access, it was under no obligation to remove the subsidy. In contrast under the SCM, if a subsidy is successfully challenged, it must be removed for there to be compliance.\(^\text{125}\) The corollary of this is that the willingness of countries to make market access commitments will be undermined if their use of subsidies is then subject to ASCM challenge. Hence the temptation to use other non-transparent domestic policies that substitute for subsidies.

Detailed assessment of why the SCM is practically ineffective has also been provided, pointing out both definitional and evidentiary problems.\(^\text{126}\) First, China challenged U.S.-use of CVDs against exports involving SOE support, on the grounds these were not subsidies from a “public body”. The Appellate Board subsequently ruled a “public body” means governments or government entities, thereby removing SOEs from the WTO definition of a subsidy.\(^\text{127}\) Second, there is a heavy burden of proof on complaining countries to show there is governmental control over an entity, and that the latter is providing a subsidy. Therefore, applying ASCM disciplines in the context of “China Inc.” is likely to prove difficult. In addition, even if a challenge can be proven, the WTO is unable to issue retrospective remedies for past harm, i.e., China gets a “free pass” for breach of the SCM before any dispute is ruled on.\(^\text{128,129}\)

The conclusion to be drawn here is that it makes sense for the United States and other WTO members to file a wide-ranging violation complaint against China, recognizing that its chances of success are likely constrained by the yet unsolved issue of defining subsidies and how they may undermine negotiated market access

C. A Non-Violation Complaint

Alternatively, both legal and economic analysts have suggested the non-violation clause GATT/WTO Article XXIII 1(b) should/could be used more aggressively against China.\(^\text{130,131}\) This clause is designed to allow a country(ies) to seek compensation from another country for the adverse market access effects of their domestic policy choices, even if the latter are not

131 See Staiger, supra note 79, at 130-134.
explicitly in violation of specific WTO obligations such as SCM. Essentially, the non-violation clause is acknowledgement that GATT/WTO is an incomplete contract, i.e., not all domestic policy choices are covered by the rules, with the attendant risk of the trade bargain being undermined. Importantly, the non-violation clause plays an important role in facilitating the “shallow” approach of GATT/WTO to international integration.

As noted earlier, while concerns have been expressed by economists about the efficacy of current GATT/WTO rules on subsidies, they do have the potential to undermine market access commitments. To that end, it has been argued that an affected country could seek redress through the non-violation clause, either through withdrawal of the subsidy or compensation. However, some commentators have pushed this idea further by arguing that the focus should be on China’s departure from their market access commitments rather than use of any specific domestic policies such as subsidies. Quoting Hillman on the possibility of the United States and other WTO members pursuing a non-violation claim,

“…It is this collective failure of China, rather than any specific violation of individual provisions, that should form the core of a big bold WTO case. Because addressing these cross-cutting, systemic problems is the only way to correct for the collective failures of both the rules-based trading system and China…”

A way of thinking about non-violation complaints is to recognize that market access effects can arise from a broad range of domestic policies that are either unregulated or only partially regulated by existing GATT/WTO rules, e.g., environmental standards, and competition policy. In principle, a non-violation complaint has the potential to resolve the market access issue. Formally, an importing government makes both trade and regulatory policy choices,

138 See Staiger, supra note 79, at 132-133.
139 See Hillman, supra note 63, at 13.
140 Interestingly Wu, supra note 92, at 109, is considerably less optimistic about the merits of such an approach, dismissing a non-violation complaint as having too high a burden of proof to be successful. In addition, he regards the current WTO rules as being incomplete, and not well-designed to deal with “China Inc.” The solution he offers is for WTO members to seek a new modality for updating rules of the multilateral trading system.
142 See Bagwell and Staiger, supra note 134, at 544-554, for a discussion of how this would work in the context of environmental regulation.
where an ex-ante contract rules out protectionist trade policy, except under special circumstances, but no such contract is available to cover regulatory policy. Interpretation by the dispute settlement body (DSB) of any policy choice is assumed “noisy”, and filing a complaint is costly.\footnote{See Staiger and Sykes, supra note 132, at 156-163.} If the importing country chooses protection, a violation complaint is filed by the exporting country, the importing country complying with any ruling against it. If the importing country chooses regulation, the exporting country can file a non-violation complaint, but if ruled against, the importing country is under no obligation to change its policy. Instead, it can either comply with the ruling or pay compensation to the exporting country. The amount of compensation received by the exporting country is less than what is actually paid by the importing country due to the deadweight losses of say tariff retaliation.\footnote{See Giovanni Maggi and Robert W. Staiger, “Trade Disputes and Settlement,” International Economic Review 59, no.1 (Feb 2018): 19-50, 20.}

An exporting country will file a claim based on expected benefits, the key parameters being the probability of success, benefits of inducing compliance in a violation claim, level of compensation in a non-violation claim, and costs of litigation. While a successful violation claim is ranked higher by an exporting country due to compliance by the importing country, non-violation is the only viable claim available to the exporting country against importing country regulation. Without the potential for non-violation claims, an importing country could influence its terms-of-trade with impunity, as well as avoid a violation claim through use of trade policy. In the language of game theory, the potential for non-violation claims serves a function off-equilibrium by deterring the importing country from selecting regulation.\footnote{See Staiger and Sykes, supra note 143, at 760-761.}\footnote{See Staiger and Sykes, supra note 132, 170-171.} \footnote{See Staiger and Sykes, supra note 141, at 743-744.}

While non-violation claims under GATT/WTO have been rare,\footnote{See Staiger and Sykes, supra note 147, at 743-744.} it has been argued they could provide China with the ability to decide how to make commitments on market access to the United States and other trading partners that would re-establish reciprocity, but if those commitments are insufficient, previous concessions on market access can then be withdrawn.\footnote{See Staiger, supra note 79, at 132-133.} Importantly, compared to the “power-based” bargaining approach to “China Inc.” of the Trump administration, utilizing the non-violation clause returns resolution of market access issues and reciprocity to the “rules-based” multilateral system. In addition, rather than presenting China with the choice of either moving towards a market-economy or leaving the WTO as has been suggested by some,\footnote{See Hillman, supra note 63, at 13} the non-violation clause gives China the flexibility to augment the commitments it made when acceding to the WTO, i.e., China could re-establish reciprocity without necessarily reforming its own economic system.

Arguably, China could well see it in its own interests to facilitate such rebalancing.\footnote{See Staiger, supra note 79, at 132.} Of course how China augments its market access commitments is an open question, but there is precedent for this when non-market economies such as Hungary, Poland, and Romania joined
the GATT in the 1960s and 1970s.¹⁵¹,¹⁵² The fact that China did sign up via the USCTA to import more from the United States suggests it is willing to make such commitments, even if there are legitimate concerns about their transparency. However, the argument here is that making such commitments relies on the multilateral system as opposed to bilateral bargaining, i.e., the United States and its trading partners file a non-violation complaint against China, which is then ruled on by the DSB, after which China re-commits to reciprocity if ruled against.

VI. CONCLUSION

The motivation for this article is the argument U.S. trade policy has shifted from a “rules-based” to a “power-based” approach, with a focus on the use of “bargaining” tariffs targeted at countries such as China. Superficially this strategy appears to have worked following implementation of the USCTA in early 2020. However, this is misleading: the United States adopted a sub-optimal strategy in switching to “power-based” bargaining. Although it resulted in the USCTA, there are multiple non-trivial caveats: China has credibly punished U.S. “bargaining” tariffs with its own retaliatory tariffs, negatively affecting U.S. farmers and taxpayers; U.S. tariffs against China, remain above their bound levels with the likelihood of continued deadweight losses to the U.S. economy; the longstanding U.S. trade deficit has not been solved through “bargaining” tariffs against China; no progress has been made on disciplining China’s use of subsidies either bilaterally or multilaterally; and the continued functioning of the multilateral trading system has been placed at risk by U.S. actions. Therefore, in coalition with other members of the WTO, the United States should file both violation and non-violation complaints against China.

Of course, this recommendation requires a functioning dispute resolution mechanism. As of December 10, 2019, the WTO’s Appellate Body ceased to function after the terms of two of the remaining Appellate Body members ended, the Appellate Body requiring at least three members to hear appeals.¹⁵³ While the current legal stalemate over the future of the Appellate Body should be seen as a symptom rather than the cause of the breakdown in the dispute settlement process, the United States’ dissatisfaction with the Appellate Body is certainly a function of how it believes it has been constrained by the latter in using trade remedies against China.¹⁵⁴ However, as noted by Professor Chow, crippling of the Appellate Body by the United States has significantly undermined the WTO, countries trade obligations no longer being enforceable. This brings with it the attendant risk that international trading relations could return to the “law of the jungle” observed during the inter-war years, with the widespread application of “vigilante justice” outside the WTO’s rules-based system.¹⁵⁵
