# MACHINERY COST ESTIMATES 

by<br>William F. Lazarus

May 2012
The tables in this publication contain estimates of farm machinery operation costs calculated via an economic engineering approach. The data are intended to show a representative farming industry cost for specified machines and operations.

Machine costs are separated into time-related and use-related categories. Use-related costs are incurred only when a machine is used. They include fuel, lubrication, use-related repairs and labor. Time-related costs, also often referred to as overhead costs, accrue to the owner whether or not a machine is used. Overhead includes time-related economic costs: interest, insurance, personal property taxes, and housing. There are no personal property taxes in Minnesota. Depreciation is both a use- and a time-related cost. Depreciation will be related to use to the extent that increased annual usage shortens years of life and/or reduces salvage value. While not entirely use-related, depreciation is included along with operating expenses and labor costs in the columns labeled "use-related cost/acre".

OVERHEAD COSTS: Time-related costs are prorated over a 12 year economic life except where otherwise indicated. Trade-in values are estimated based on American Society of Agricultural Engineers formulas. Income tax implications are ignored. A housing charge of 67 cents per square foot of shelter space needed per year is made.

A four percent "real" (inflation-adjusted) interest rate is used in the cost estimates. This real rate is calculated by taking a nominal rate charged by lenders, minus a measure of the inflation rate per year expected over the years of ownership. Insurance is charged at 0.85 percent of the undepreciated value. The interest and insurance cost formulas have one year's depreciation added to the numerator in effect bases the costs on the value at the beginning of each year owned. This gives a slightly more accurate calculation of the actual costs over the years owned. Salvage value are also adjusted for inflation so that depreciation is also on an inflation-adjusted basis. In states where farm machinery is taxed as personal property, property tax could be calculated in a similar manner, depending on how taxes are assessed.

Formulas used to compute machinery overhead costs:
 2

Housing, $\$ /$ year = price per sq. foot x sq. feet shelter space required
Taxes per year $=0$ (no taxes on personal property in Minnesota)

USE-RELATED COSTS: Fuel cost is calculated by multiplying the fuel consumption by the price of fuel, with fuel consumption assumed to be 0.044 gallons of diesel fuel per PTO horsepower-hour on average for each implement type. Fuel consumption per acre is averaged across sizes within a given implement type. The price of farm diesel fuel is projected at $\$ 3.60$ per gallon. All power units, tractors, combines, trucks, etc., use diesel fuel. Lubrication cost is assumed to be 10 percent of fuel cost.

The formulas for repair and maintenance costs estimate total accumulated repair costs based on accumulated hours of lifetime use. Repair and maintenance calculations are based on American Society of Agricultural Engineers formulas. The total cost is then divided by accumulated hours to arrive at an average per hour cost estimate. The amount of annual use of a machine is an estimate of the number of hours a commercial farmer would use that particular machine in one year.

Labor is charged at hourly rates that include 30 percent benefits. The charge rates are $\$ 15.00$ per hour for unskilled labor and $\$ 20.00$ per hour for skilled labor. The skilled labor rate is generally used with the planting and harvesting equipment and sprayers. Labor per acre for an operation such as plowing or disking is calculated by using the work rate on the implement. Less labor per acre is used in a disking operation that covers more acres per hour than in a plowing operation. A small amount of extra labor is added over and above machine time to allow for downtime for tasks such as making adjustments and filling sprayers and planters. The labor adjustment ranges from 2 percent additional time for tillage to 33 percent for spraying.

Economic depreciation is included in use-related costs, calculated using the straight-line formula:

Depreciation, $\$ /$ year $=\quad$| purchase cost - salvage value |
| :---: |
| ----------------------------- |

These estimates will not represent any given individual's cost. Differences in buying power, repair programs, average annual use, and overall replacement programs should be considered when making adjustments. It may be useful to record actual expenses for at least a few of your implements and compare your costs to these estimates. These estimates will differ from records because they are estimates, but also because they are averaged over the use period and are expressed in today's dollars. If these estimates are compared to recorded costs that include repairs or depreciation based on historical costs, one adjustment that would be required for comparability would be to index the historical cost to current prices.

THE BOTTOM LINE: Machinery costs are substantial; control of them is important. Custom charges are often based upon them. No one should do custom work unless the charge will cover operating costs and use-related depreciation plus a return for one's risk and time. Ideally, all allocated per acre or hour overhead costs should also be covered by anyone offering to do custom work. The market for custom work usually does not cover all costs. The market is usually somewhere in between the Use-related costs and total costs.

## ACCESS TO EDUCATIONAL PROGRAMS AND MATERIALS:

The University, including the University of Minnesota Extension Service, is committed to the policy that all persons shall have equal access to its programs, facilities, and employment without regard to race, color, creed, religion, national origin, sex, age, marital status, disability, public assistance status, veteran status, or sexual orientation.

Summary of Per Acre Use-Related Costs and Total Cost for Implements with Associated Power Units, Averaged Over All Sizes by Implement Type

| Use-Related Cost/Acre ${ }^{1}$ |  | Total Cost/Acre |
| :---: | :---: | :---: |
| Chisel Plow | \$7.94 | \$9.99 |
| Chisel Plow, Front Disk | \$11.22 | \$13.95 |
| Moldboard Plow | \$18.35 | \$22.11 |
| Field Cultivator | \$4.69 | \$5.86 |
| Tandem Disk | \$8.69 | \$10.75 |
| Offset Disk | \$10.76 | \$12.95 |
| V-Ripper | \$11.15 | \$13.62 |
| Comb Disk \& V-Ripper | \$16.89 | \$20.99 |
| Row Crop Planter | \$8.26 | \$11.02 |
| Min-Til Planter | \$11.09 | \$14.01 |
| Presswheel Drill | \$9.82 | \$12.19 |
| Air Seeder Drill w/Cart | \$13.18 | \$17.70 |
| No-Till Drill | \$16.99 | \$21.47 |
| Prairie Grass Drill | \$14.69 | \$20.11 |
| Row Cultivator | \$5.73 | \$7.01 |
| Rotary Hoe | \$2.24 | \$2.67 |
| Boom Sprayer, SelfProp | \$5.65 | \$7.73 |
| Boom Sprayer, PullType | \$2.38 | \$3.17 |
| Stalk Shredder | \$10.57 | \$12.95 |
| Mower-Conditioner | \$10.47 | \$13.04 |
| Rotary Mow/Conditioner | \$7.20 | \$9.18 |
| Hay Rake | \$5.13 | \$6.04 |

|  | Use-Related <br> Cost/Acre | Total <br> Cost/Acre |
| :--- | ---: | ---: |
| Hay Swather-Cond | $\$ 8.70$ | $\$ 11.31$ |
| Swather-Cond, Self- <br> Prop | $\$ 15.64$ | $\$ 23.75$ |

${ }^{1} \mathrm{HP}$ shown for the smaller tractors is PTO horsepower. Engine HP is shown for the larger tractors. PTO HP for the larger tractors runs about $87 \%$ of engine HP, and is shown in parentheses. Fuel use is estimated at 0.044 gallons of diesel fuel per hour per PTO HP.
${ }^{2}$ Net cost of a new unit assumes no trade-in. Farm machinery is exempt from sales tax in Minnesota so no sales tax is included.
${ }^{3}$ Overhead costs include interest, insurance, and housing but not depreciation, which is shown separately because it varies to some extent with use. Overhead p $\epsilon$ hour will vary with annual use.

## ${ }^{1}$ Net cost of a new unit assumes no trade-in. Farm machinery is exempt from sales tax in Minnesota so no sales tax is included

${ }^{2}$ Power cost per acre for the power unit assigned to each implement multiplied times that implement's acres/hour equals that power unit's total cost per hour shown in the "Tractors, Combines, and Self-Propelled Forage Harvesters (Without Heads)" table above.
${ }^{3}$ Overhead per acre will vary with annual use.
 Fuel is included in power cost
${ }^{5}$ Use-related cost/acre is included in the total cost/acre amount. Use-related cost/acre includes everything in total cost/acre EXCEPT that non-depreciation overhead costs (interest
 words, depreciation is considered here to be at least partially use-related even though it is commonly thought of as being mainly time-related.

[^0]:    ${ }^{1}$ Use-related cost/acre includes fuel, lubricants, repairs and maintenance, labor, and power and implement depreciation (depreciation is both time-related and use-related). The difference between use-related cost and total cost is that total cost also includes overhead costs (interest, insurance, and housing).
