

# "High Food Prices and Riots: Trade Policy vs. Safety Nets"

Ian Sheldon Andersons Professor of International Trade

# **Spikes in World Food Prices**

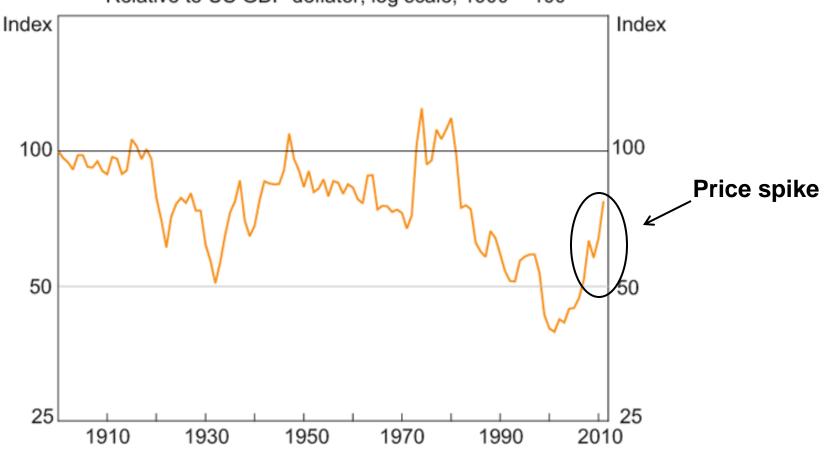

- Since 2007 world prices of key staple foods volatile around relatively high levels
- Different to pattern over past century where real food prices have trended downwards
- Historically, while price spikes are often intense, they have typically been infrequent
- Since 2008, three price spikes: early 2008, early 2011, and third quarter of 2012

### Real Food Price Trend

Food Prices\*

Relative to US GDP deflator, log scale, 1900 = 100

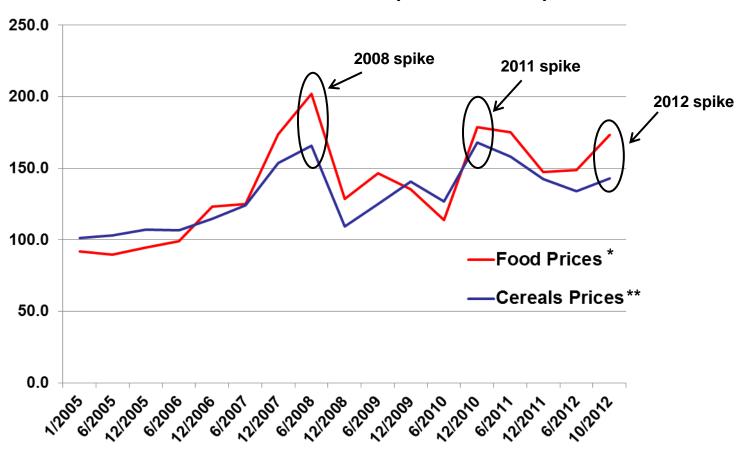

\* Equal weighted (geometric) index of 11 commodities; extended from 2004 using IMF commodity price series; latest data point is 2011 to date Sources: Global Financial Data; IMF; RBA; World Bank

### **Recent Food Price Spikes**

#### FAO Real Food Price Indices (2002-04=100)

<sup>\*</sup>Food price index based on average of 5 commodity groups (meat, dairy, cereals, oils and fats, and sugar)

<sup>\*\*</sup>Cereals prices index based on wheat, maize, and rice prices

# Response to Food Price Spikes

- Many developing countries have responded to food price spikes by directly intervening to stabilize domestic markets
- 2008: 68 countries used trade policies and 35 released public stocks at subsidized prices (FAO, 2008)
- Trade policies have consisted of export controls, import subsidies and tariff reductions
- In contrast, developed countries have typically not implemented such policies

# **Standard Policy Advice**

- 1945-80, focus on price stability through production, border and stock controls
- Post-1980, price stability considered less desirable - production, trade and storage decisions should be guided by market prices
- Policy advice: market-based risk-management tools in combination with safety nets
- Drew criticism after price spikes:
  - risk-management tools often unavailable
  - safety nets too complex to use
  - poor food importing countries hurt most

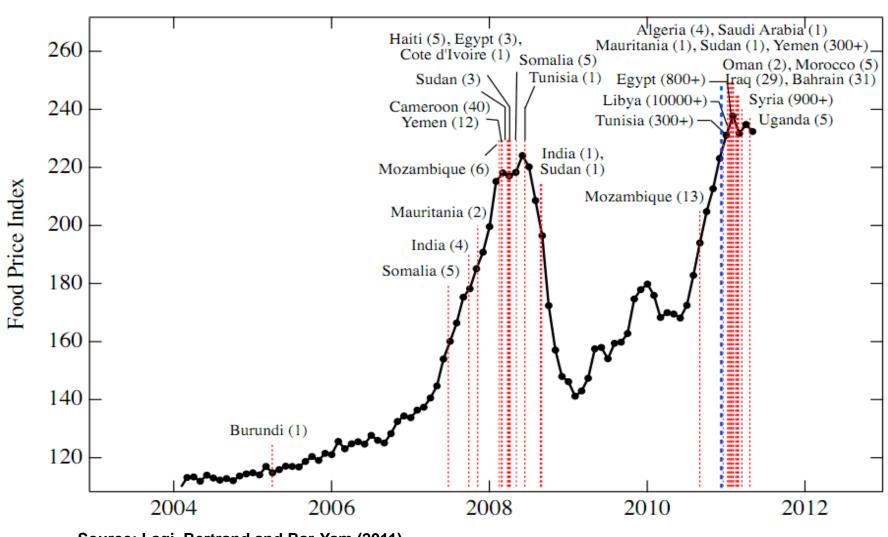

# Political Impact of Higher Prices

- Higher food prices found to increase poverty sharply in short-run (World Bank, 2012)
- Research suggests food riots are correlated with high food prices (Bellemare, 2011)
- Intervention a matter of political survival in countries with large poor populations
- Indian Prime Minister and Indonesian President both re-elected in 2009 after campaigns emphasizing ability to limit impact of food crisis in respective countries

## **Impact of Higher Food Prices**

#### **High Food Prices and Political Unrest**

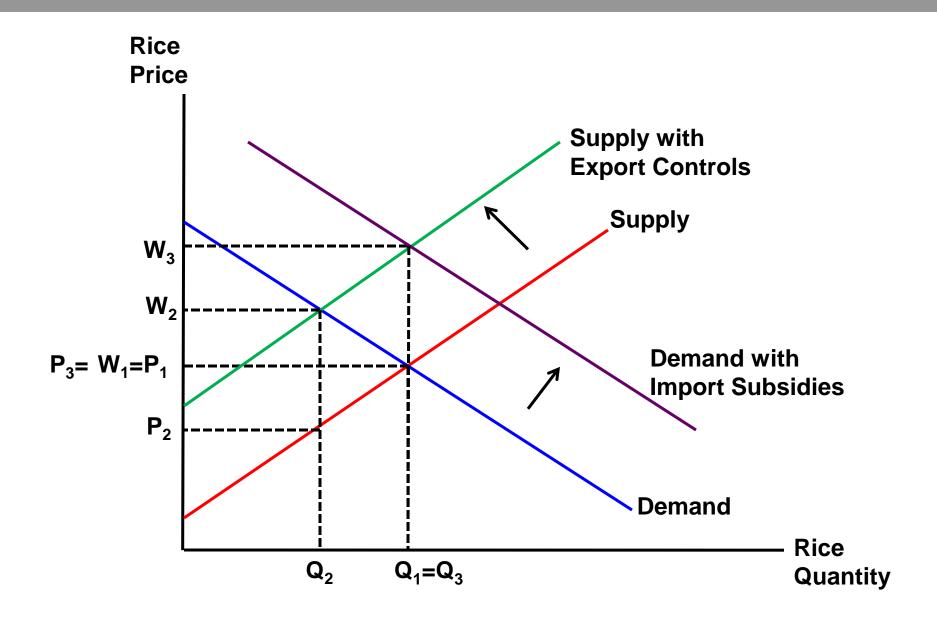

Source: Lagi, Bertrand and Bar-Yam (2011)

# Beggaring Thy Neighbor....

- If enough countries adopt trade policies, end result is increased world food price instability
- "...export restrictions play a direct role in aggravating food crises..." (Pascal Lamy, Director General of WTO, 2011)
- 40%, 19% and 10% of 2007-08 spike in rice, wheat and maize prices respectively due to trade policies (Anderson and Nelgen, 2012)
- Unless countries cooperate over not using trade policies, each has unilateral incentive to intervene, but collectively no better off

## **World Rice Market**

## **Safety Nets**

- Mixed record of stabilization policies has led to focus on risk management and safety nets
- Latter are non-contributory targeted transfers designed to provide assistance to the poor following price shocks
- Various forms: cash transfers, food stamps, food-for-work, and cash-for-work programs
- Provide insurance to poor who have limited access to formal coping mechanisms – i.e., entitlements matter (Sen, 1981)

# **Safety Nets**

- Often complement stabilization policies, which may be insufficient to protect purchasing power of poor
- In response to 2007-08 food price spike, 23 countries used cash transfers, 19 food assistance, and 16 chose policies to increase disposable income (FAO, 2009)
- Safety nets have been crucial in protecting poor from price increases – e.g., Mexico's Progresa program
- Options for transfers also improving

# Safety Nets vs. Trade Policies

- Why are safety nets not used more often?
  - Hard to scale up/down depending on need
  - Fiscal constraints
- Trade policies often less costly, and also politically popular if safety nets leave share of middle-class unprotected
- Despite being targeted, safety nets may still distort world prices, i.e., result in exports being reduced/imports increased
- However, trade polices tend to over-react to shocks while safety nets tend to under-react

# **Disciplines on Trade Policy**

- Trade policies often appear successful in stabilizing domestic prices, but end up exacerbating world price spikes
- Solution to prisoner's dilemma is cooperation via a self-enforcing agreement, i.e., the WTO
- Current Doha Round pushing for reductions in tariffs and disciplines on export subsidies
- Developed countries also pushing for tighter WTO disciplines on export restrictions – but rejected by exporting developing countries

# **Reconsidering Biofuels Policies**

- Developed countries did not use export policies in response to recent price spikes as compared to 1973/74
- However, developed country policies on biofuels have had large terms of trade effects for coarse grains, oilseeds and sugar
- Mandates also result in demand for biofuels being unresponsive to food prices – as a result harder to moderate price shocks
- Focus should be on developing biofuels that have a less distorting effect on world prices
